

Dear Dell:

Ida-Rose here. Tracy has gone over to see why our fax doesn't print out better. There is one suggestion I would make.

Paragraph 2:

Tracy's first machine, the belt, was invented while Tracy was still at G.E. He also in December of 1954, also succeeded in being the first to be successful in producing diamonds in the Belt, also at G.E. It was when he left G.E. and went to BYU that Vannevar Bush so generously, and entirely without solicitation made his 10,000 dollar contribution that made it possible for Tracy to build the Tetrahedral press. The Tet opened up the field of high pressure-high temperature research.

Tracy just came home, and WHOOPEE, the last of Tracy's letter's came from Doug Rock of Smith International. Bless his heart he sent it express-overnight.

We are going to fax you copies of all the letters, so that you can see exactly what each one had to say. That will help you to do your Cover letter.

The company we bought our fax from said that the printing is as good as it gets on that machine, but that for \$300 more we could get a lazer fax printer which would be better. That will be about a week.
