

suggest that the free energy change of the reaction:

is extremely small, a few hundred calories at the most. As the uncertainty in the free energy of leonhardite is 1400 cal., we may equate the free energies of kaumontite reactions to those known for leonhardite.

From table 3 we obtain the following data for the reaction:

$$\Delta G^\circ = +4.4 \text{ Kcal} ; \Delta S^\circ = -16.65 \text{ e.u.} ; \Delta V^\circ = -68.35 \text{ cm}^3.$$

If we assume that  $\Delta G^\circ$  for reaction (3) is small, then for reaction (1) we obtain:

$$\Delta G^\circ = +2.2 \text{ kcal} ; \Delta S^\circ = -5 \text{ e.u.} ; \Delta V^\circ = -22.55 \text{ cm}^3.$$

The entropy of kaumontite has been estimated by considering average water contributions to leonhardite. Thus the high entropy assemblage kaumontite is stable at low temperature. Therefore, as temperature increases kaumontite be-

TABLE 3  
Thermodynamic properties of minerals, water, and carbon dioxide at 25°C  
and 1 atmosphere

Mineral	$S_{298,1K}^{\circ\circ}$	$\Delta G_{298,1K}^{\circ\circ}$	$V$
	cal/deg mole	keal/mole
