

FIG. 5. Vector diagram for elastic wave interaction with the free surface.

to be reflected at the free surface. The vector diagrams in Figs. 5 and 6 show the material velocities associated with each of these waves and their relation to the free surface angles which may be measured in each experiment. In addition, in order to use Eqs. (3) and (4) to find the stress and strain behind each wave, it is necessary to determine the material velocities, U_{p1} and U_{p2} , which occur behind the first and second waves within the sample.

From Fig. 5, the free surface angle θ_1 , is

$$\tan\theta_{1} = \frac{(1+r_{1})\cos\alpha_{1} + r_{2}\sin\alpha_{2}}{1/\epsilon_{1} - (1-r_{1})\sin\alpha_{1} - r_{2}\cos\alpha_{2}},$$
 (7)

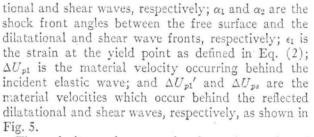

where

and

 $r_1 = \Delta U_{p1}' / \Delta U_{p1}$

 $r_2 = \Delta U_{ps} / \Delta U_{p1}$

are the reflected material velocity ratios for the dilata-

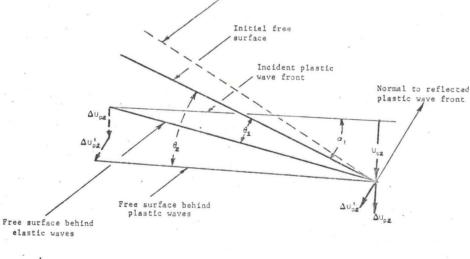

The velocity ratios are related to the angles of obliquity e and f as shown in Fig. 5 by the relationships⁹⁻¹¹

$$\frac{\Delta U_{pl}}{\Delta U_{p1}} = \frac{4 \tan f \tan e - (\tan^2 f - 1)g(\nu)}{4 \tan f \tan e + (\tan^2 f - 1)g(\nu)} \tag{8}$$

and

$$\frac{\Delta U_{ps}}{\Delta U_{p1}} = \frac{-4 \operatorname{taneg}(\nu)}{4 \operatorname{tane} \operatorname{tan} f + (\operatorname{tan}^2 f - 1)g(\nu)}, \qquad (9)$$
