F APPLIED PHYSIC

scent at constant temperature. The fact that first is good agreement between the data of side, who used the piston displacement method, and that of Dow, and Dow and Fenske, who used say lphon method, would seem to indicate, superior, that the absolute error involved in the apparements under consideration at constant engerature might be somewhat less than what would otherwise be expected.

Probably the source of greatest error lies in the antipolation and extrapolation. Data were availand at only three temperatures; namely, 77°, 14, and 167°F. By interpolation and extrapolaof these data, a system was evolved by grans of which densities can be calculated at gorvals of 10° between the limits of 20° and TF. The method employed was to construct mutive density-temperature isobars at atmoshere pressure, 10,000 lb./in.2, and 20,000 lb./in.2 marading off the relative densities at 77°, 104° and 167°F from the relative density-pressure grees already described. While only three points used to determine these isobars, the uncerunity in locating the curves accurately was not great as might be expected at first thought. tentive density increases slowly with temperaat constant pressure, and for the experiretal range considered here does not depart mally from linearity. Moreover, the isobar at mospheric pressure could be located with exaccuracy with the aid of the National hereau of Standards tables6 that show the change density of petroleum oils with temperature at emospheric pressure. At this point it is to be and that the National Bureau of Standards indicate that oils in the range of specific mity of the present ones under consideration a thermal coefficient of expansion of #X10-5 per °F at atmospheric pressure. The graces of the corresponding values reported by and by Dow and Fenske³ were 37×10⁻⁵ of \$1\times 10⁻⁵, respectively. This variation of the Scient can be taken as the possible error in temperature measurements, since the appaused at the National Bureau of Standards doubtless better suited to measuring the mospheric isobar than the sylphon apparatus

Ational Bureau of Standards Circular C410, United Government Printing Office, Washington, D. C.

used by these other investigators. Thus the atmospheric isobar was first corrected to bring it into line with the National Bureau of Standards values, and the other isobars were then corrected correspondingly. By using this system of correction, the actual shape of the density-pressure curves was left unchanged, and the intercept on the density axis was corrected only to bring the atmospheric densities into line with the National Bureau of Standards tables.

DENSITY EQUATION

In order to express the graphical results in a simple form that can be used readily for the calculation of density at various pressures and temperatures when the density at atmospheric pressure is known at a particular temperature, the following empirical equation was developed,

$$\rho = \rho_0 (1 + ap - bp^2) \iota. \tag{1}$$

In this equation ρ is the density in g/cm³ at any stated temperature t and pressure p, and ρ_0 is the density at the same temperature at atmospheric pressure. Temperatures are expressed in degrees Fahrenheit and pressures in pounds per square inch gage. The symbols a and b represent constants at any given temperature. Values for a and b are given in Table II.

TABLE II. Density constants a and b as functions of temperature.

TEMP.	a	ь	TEMP.	а	b
20	3.96×10 ⁻⁶	7.3×10 ⁻¹¹	130	4.50×10 ⁻⁶	5.3×10 ¹¹
30	4.02	7.0	140	4.53	5.1
40	4.08	6.8	150	4.56	5.0
50	4.14	6.6	160	4.59	4.9
60	4.19	6.4	170	4.61	4.8
70	4.24	6.2	180	4.63	4.7
80	4.29	6.0	190	4.64	4.6
90	4.34	5.8	200	4.66	4.5
100	4.38	5.7	210	4.67	4.4
110	4.42	5.5	220	4.68	4.4
120	4.46	5.4			

The method used to compute the values of a and b is readily explained. For each of the temperatures listed values of ρ/ρ_0 were taken from the isobars constructed as described in a previous section, and a and b were evaluated using simultaneous equations of the type of Eq. (1). The values so calculated were then plotted as shown in Fig. 1 and Table II was constructed
