

~300 Oe.) It must be pointed out that in certain cases [4, 5] magnetic sublattice inversion is not a phase transition of the first kind, and is spread over a field-strength region of the same order as that observed experimentally. An investigation of the mechanisms considered in [4, 5] is of independent interest. The methods we have used to attain exact angular alignment make it hopeful that such an investigation will be completed soon. The transition width found in the present study cannot be unambiguously interpreted, due to the masking effect of the demagnetizing fields of the specimen. The experimental conditions did not permit this to have the shape of an ellipsoid, so the demagnetizing fields in the specimen were nonuniform with a strength estimated at ~400 Oe, which fully explains the observed transition region width.

A relatively small transition width may be quite sensitive toward the state of a crystal. In our experiments the effects of structure defects on transition widths were not investigated. From the reproducibility of the results and the absence of any traces of block structure under the polarizing microscope as on x-ray photographs, it may be expected that their contribution would have been negligible. When pressure was applied the transition width increased, doubling at $p \sim 2.5$ katm. We suggest that this broadening was due to deviation of the pressure axis direction away from the ordering axis by $\pm 5^\circ$ and to pressure nonuniformity in the bulk of the specimen.

4. EXPERIMENTAL RESULTS

Figure 2 shows the differential susceptibilities χ_d of both specimens plotted against the magnetic field strength, with a uniaxial pressure of 2.5 katm applied to one specimen. The absolute value of the critical field for a free specimen (first χ_d splash) at 4.2°K was 91.7 ± 1 kOe, according to our measurements. The critical field of the compressed specimen, determined from the position of the second splash, was displaced by 700 Oe. The error in the relative scales of the magnetic field on the oscillogram is estimated at 5%.

Imposition of uniaxial pressure on a specimen leads not only to a shift in H_C but also to a broadening of the transition. This makes measuring the shift more difficult, particularly at low pressures, when the individual splashes are poorly resolved. By stabilizing the supply circuits to the apparatus it was later possible to get quite good reproducibility in the position of the χ_d maximum on the scale (not poorer than 50 Oe), which allowed the free-

specimen peak to be distinguished. This made it possible to determine the H_C shift for lower pressures.

Figure 3 is a graph of the relationship $\Delta H_C(p)$. Within experimental error limits it can be described as a straight line of slope $(1/H_C)(dH_C/dp) = 2.9 \cdot 10^{-12}$ cm²/dyn.

These results were reproduced with three specimens, and the relationship quoted refers to a specimen in the shape of a cylinder ($D = 0.76$ mm, $l = 1.2$ mm).

5. DISCUSSION

Returning to the problem expressed at the beginning of the article, we will consider the individual mechanisms contributing to the measured values of $H_C(p)$. These include: 1) classical magnetostriction; 2) change in the anisotropy constant with pressure; and 3) the sought-for quantity $d\chi_{\perp}/dp$. The first two contributions can be calculated, and the last one found by experiment. Classical magnetostriction is a phenomenon in which a magnetic substance in an external field is subject to forces causing its elongation along the magnetic field direction and its compression perpendicular to this direction. With the specimen form factor taken into account, evaluations in [6] give $\Delta U_C = 0.24 \cdot 10^{-5}$ and hence $[(1/H_C)(dH_C/dp)]_{\perp} = 0.27 \cdot 10^{-12}$ cm²/dyn. Possible inaccuracies in determining the specimen's effective form factor are not of particular importance in view of the small size of the contribution.

The anisotropy energy of the crystals considered is almost entirely of magnetic-dipole origin [7], with the anisotropic part of the magnetic dipole field equal to

$$H_a = \sum_i \frac{3(\mu r) r}{r_i^5}, \quad (2)$$

Fig. 3. Relative changes in the critical field values of a MnF_2 specimen plotted against uniaxial pressure applied along the four-fold axis. The broken lines enclose the average scatter values of the experimental points.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that proper record-keeping is essential for the integrity of the financial system and for the ability to detect and prevent fraud.

2. The second part of the document outlines the various methods used to collect and analyze data. It describes the use of statistical techniques to identify trends and anomalies in the data, and the importance of using reliable sources of information.

3. The third part of the document discusses the role of the auditor in the financial system. It explains that the auditor's primary responsibility is to provide an independent and objective assessment of the financial statements, and to ensure that they are prepared in accordance with the applicable accounting standards.

4. The fourth part of the document discusses the importance of transparency and accountability in the financial system. It explains that transparency allows stakeholders to make informed decisions, and that accountability ensures that those responsible for the financial system are held to account for their actions.

5. The fifth part of the document discusses the role of the regulatory body in the financial system. It explains that the regulatory body is responsible for developing and enforcing the rules that govern the financial system, and for monitoring the system to ensure that it is operating in a safe and sound manner.

6. The sixth part of the document discusses the importance of risk management in the financial system. It explains that risk management is the process of identifying, measuring, and managing the risks that are associated with the financial system, and that it is essential for the system to be able to withstand shocks and stresses.

7. The seventh part of the document discusses the importance of financial literacy in the financial system. It explains that financial literacy is the ability to understand and use financial products and services, and that it is essential for individuals to be able to make informed decisions about their financial future.

8. The eighth part of the document discusses the importance of international cooperation in the financial system. It explains that the financial system is a global system, and that it is essential for countries to work together to address the challenges that are facing the system, and to ensure that it is able to support the world economy.

9. The ninth part of the document discusses the importance of innovation in the financial system. It explains that innovation is the process of developing new products and services, and that it is essential for the financial system to be able to meet the needs of its customers and to remain competitive in a global market.

10. The tenth part of the document discusses the importance of consumer protection in the financial system. It explains that consumer protection is the process of ensuring that consumers are able to make informed decisions about the financial products and services that they use, and that it is essential for the financial system to be able to protect the interests of its customers.

11. The eleventh part of the document discusses the importance of financial stability in the financial system. It explains that financial stability is the state of the financial system in which there is no significant risk of a systemic crisis, and that it is essential for the financial system to be able to support the world economy.

12. The twelfth part of the document discusses the importance of financial inclusion in the financial system. It explains that financial inclusion is the process of ensuring that all individuals and businesses have access to the financial system, and that it is essential for the financial system to be able to support the economic growth of all countries.

13. The thirteenth part of the document discusses the importance of financial resilience in the financial system. It explains that financial resilience is the ability of the financial system to withstand shocks and stresses, and that it is essential for the financial system to be able to support the world economy.

14. The fourteenth part of the document discusses the importance of financial sustainability in the financial system. It explains that financial sustainability is the ability of the financial system to maintain its current level of performance over the long term, and that it is essential for the financial system to be able to support the world economy.

15. The fifteenth part of the document discusses the importance of financial integrity in the financial system. It explains that financial integrity is the state of the financial system in which there is no significant risk of fraud or other forms of misconduct, and that it is essential for the financial system to be able to support the world economy.

16. The sixteenth part of the document discusses the importance of financial transparency in the financial system. It explains that financial transparency is the state of the financial system in which all transactions are recorded and reported in a clear and concise manner, and that it is essential for the financial system to be able to support the world economy.
