ture. They have been represented in Table 7 together with the values given by International Critical Tables<sup>12</sup>. There have been little differences of 0.32 and 0.17% between both their values at 25 and 50°C respectively, but they have agreed well within the experimental error of this work at 75, 100 and 125°C.

The specific volumes of ammonia of this work have been represented graphically in Fig. 6 plotting them *vs.* temperature at even pressures. It is shown that they increase together with the increase of temperature and this tendency is more conspicuous with decreasing pressure.
