

from ideal experimental conditions in the belt apparatus, and in noting differences in the microstructure of kyanite.

Acknowledgment

This paper is a revised version of a report covering work conducted from April 1, 1959, to March 31, 1960, at the General Electric Company Research Laboratory under USAF Contract No. AF-33 (616)-6295. This contract was initiated under Project No. 7351, "Metallic Materials," Task No. 73517, "Unique Metallic Materials and Techniques."

The work was administered under the direction of the Metals and Ceramics Laboratory, Materials Central, Wright Air Development Division, Wright-Patterson Air Force Base, Ohio, with S. A. Wolfener as project engineer. It is a pleasure to acknowledge the support of the United States Air Force.

The writer is also indebted to Mrs. Mary Houle for her skillful preparation of polished sections and photomicrographs; to S. P. Mitoff, G. W. Sears, J. D. Mackenzie, and others for valuable discussions; and to W. Claussen for going to the high-pressure equipment. The writer is particularly grateful for the critical comments of Rustum Roy.
