

## TECHNICAL NOTE

where the initial bulk modulus is

$$B_0 = \left\{ -V \left( \frac{\partial P}{\partial V} \right)_T \right\}_{P=0},$$

and the corresponding pressure derivative

$$B'_0 = \left\{ \left( \frac{\partial B}{\partial P} \right)_T \right\}_{P=0}.$$

The elastic constants of Bell and Rupprecht [5] were used to calculate  $B_0 = 1.76 \times 10^3$  kbar and the best fit to our data was obtained with  $B'_0 = 4.4$ .

One can determine the Grüneisen parameter for  $\text{SrTiO}_3$  from the Grüneisen relation[7]

$$\gamma = \frac{\alpha V_m}{\beta C_v},$$

where  $\alpha$  is the volume thermal expansion,  $V_m$  is the molar volume,  $\beta$  is the compressibility, and  $C_v$  is the specific heat at constant volume. At room temperature and atmospheric pressure, the values of the various parameters are  $\alpha = 2.6 \times 10^{-5^\circ}\text{K}$ [8],  $\beta = 5.67 \times 10^{-13} \text{ cm}^2/\text{dyne}$ [5],  $C_v = 20.7 \text{ cal/mole}^\circ\text{K}$ [9] and  $V_m = 35.7 \text{ cm}^3/\text{mole}$ ; using these values, one calculates  $\gamma = 1.89$ . The  $B'_0$  obtained from the least squares fitted Murnaghan equation can be used to calculate the Grüneisen parameter by an independent

method; Anderson[10] has shown that

$$\gamma = \frac{B'_0 - 1}{2}.$$

As mentioned previously, the data was best fit with  $B'_0 = 4.4$ , and thus  $\gamma = 1.7$ , in reasonable agreement with the value calculated above.

*Acknowledgements*—The  $\text{SrTiO}_3$  sample used in this investigation was kindly provided by J. E. Hesse and J. Matsko of this laboratory. The authors gratefully acknowledge the technical assistance of Clarence Huddle.
