<sup>A</sup> Mean values from the results of Hamann and Strauss,<sup>12</sup> Ellis and Anderson<sup>13</sup> and Lown *et al.*<sup>10</sup>

<sup>B</sup> From the measurements of Linov and Kryukov.<sup>6</sup>

<sup>C</sup> From the measurements of Hamann and Strauss.<sup>12</sup> The values listed here differ slightly from those originally published. A correction has been applied for changes in the cell constant of the conductance cell caused by the high pressure phase transitions<sup>14-16</sup> of Teflon.

**Fig. 2.** A logarithmic plot of the ionization constant of ammonium hydroxide in water at high pressures, at 45°C, and of water at 25°C. The solid curves are given by equation (12), the dashed curves by the equation of Lown *et al.*<sup>17</sup> and the dotted curve by Owen and Brinkley's equation (5).

El'yanov's analysis (see Tables 2 and 3 of ref.<sup>9</sup>) shows that the function  $\Phi$  is effectively independent of the temperature for ionization reactions in water—at least between 18 and 75°C. It follows that it should be possible to apply equation (12)

over a range of temperatures using a constant value of  $b = 9.2 \times 10^{-5} \text{ bar}^{-1}$ . Table 3 and Fig. 3 show that it gives a good description of the ionization of acetic acid in water over the very wide range of temperatures from 25 to 225°C, at pressures between 0 and 3 kbar.<sup>17</sup> At 225°C, water has a dielectric constant of only 30 to 40 in that range of pressures,<sup>18</sup> so that it is quite a different medium from ordinary water at 25°C. Nevertheless, the formula still applies, with the same value of  $b$ .

**Table 3. Relative molal ionization constants of acetic acid in water at high pressures**  
Experimental values of  $K_P/K_0$  are in ordinary type and calculated values are in *italics*

| Temp.<br>(°C) | $\Delta V_0$<br>( $\text{cm}^3 \text{ mol}^{-1}$ ) | $K_P/K_0$ values at pressures $P$ (kbar) |             |             |             |             |             |

<sup>A</sup> Experimental values of Lown, D. A., Thirsk, H. R., and Lord Wynne-Jones, *Trans. Faraday Soc.*, 1970, **66**, 51.

<sup>B</sup> Values calculated from formula (12), with  $b = 9.2 \times 10^{-5} \text{ bar}^{-1}$ .

**Fig. 3.** A logarithmic plot of the ionization constant of acetic acid in water at high pressures and high temperatures. The curves are given by equation (12).

### The Pressure Dependence of $\Delta V$

Substitution of (12) into (1) and (3) gives the following relationships

$$\Delta V_P = \Delta V_0 / (1 + bP)^2 = W \Delta V_0 \quad (13)$$

$$\Delta \kappa_P = 2b \Delta V_0 / (1 + bP)^3 = X \Delta V_0 \quad (14)$$

which describe the pressure dependences of  $\Delta V$  and  $\Delta \kappa$ . When  $P = 0$ , (14) reduces to  $\Delta \kappa_0 = 2b \Delta V_0 = (1.84 \times 10^{-4} \text{ bar}^{-1}) \times \Delta V_0$ , which is fairly close to the proportionality observed by Lown *et al.* (see the discussion of equation (7)).
