<sup>(</sup>a) The  $k_n$ , K,  $\alpha_r$ , and  $\alpha_m$  are defined by Equations (3), (4), and (13a, b), respectively. Material data are given in Table 1. The liner is 18% Ni steel and the outer cylinders are H-11 steel.

<sup>(</sup>b)  $\sigma_r$  is the radial stress,  $\sigma_{\theta}$  the hoop stress, S the shear stress (S =  $(\sigma_{\theta} - \sigma_r)/2$ ), and  $\sigma_1$  is the design strength – less than or equal to the ultimate tensile strength of the liner.

<sup>(</sup>c) E is the modulus of elasticity of the outer cylinders.  $\Delta_n$  is interference in inches between cylinders n and n + 1.  $r_n$  is the outer radius of cylinder n.

<sup>(</sup>d)  $E\Delta_1/r_1p$ , at elevated temperatures, depends on p.  $\sigma_1 = 310,000$  psi is required,  $(p = 0.9727 \sigma_1)$ .
