Cambridge, Massachusetts 02139

Dear Dr. Garland:

I have read with interest your recent paper, "Order-disorder phenomena. VIII. Acoustic attenuation and dispersion in NH_4Cl ." I am in the process of compiling information on high pressure phases of the compounds and would like your opinion of a paper by Yu. A. Klyuev entitled, "Spectral Investigation of the λ Phase Transition in NH_4Cl under Pressure" (copy enclosed). In looking for the λ transition, Dr. Klyuev made his measurements at room temperature from about 9 to 23 kilobars. The "13-15" kbar point at room temperature is well below the β - α boundary. Is there any possibility he is observing the λ transition and is the method of measuring the variation of the half width of some absorption bands a valid criteria for the detection of this transition?

I would be most appreciative for any help you can give me on the above questions. Thank you very much.

Sincerely,

Leo Merrill
