- <sup>17</sup>No measurements were made on this sample at 1 atm, and these  $r$  values should not be directly compared with that for sample *B*.
- <sup>18</sup>An additional confirmation of this reversible reduction of the peak  $C_p$  value with pressure was obtained from a series of measurements on a third ND<sub>4</sub>Cl sample. Data were taken only in the immediate vicinity of the transition for isobars at 760, 1100, 1500, and 2730 bar. A smooth monotonic decrease in peak  $C_p$  values was observed with increasing pressure, and the 760 bar value was shown to be reproducible after pressure cycling. Our thanks to G. Kasting for carrying out this investigation.
