

---

\*\*(Footnote R.p. 951) The quantities in parentheses are molar concentrations.

---

increasing pressure at  $475^{\circ}$  at an exptl. duration of three hours. It was shown that under the indicated conditions this ratio increases with pressure. (It is approximately proportional to the initial hydrogen pressure).

---

Fig. 1. Effect of initial hydrogen pressure on the ratio ..... at  $475^{\circ}$  ( $t=3$  hours).

(key)

1) atm

2) initial

---

Fig. 2 shows the dependence of the ratio on the yield of benzene (in mole per cent) to the overall yield of toluene and ethylbenzene as a function of the initial hydrogen pressure at  $475^{\circ}$  for different exptl. durations.

---

Fig. 2. Effect of initial hydrogen pressure on the ratio (benzene): [(toluene)+(ethylbenzene)] at  $475^{\circ}$ . a - 2 hours, b - 3 hours, c - 4 hours, d - 5 hours.
