

Comparison of the same six points of Michels with the values predicted by the equation of state developed here shows a mean density deviation of 0.03 percent.

An abundance of thermodynamic data for argon is available in the literature. However, it is only quite recent that investigators have begun to appreciate the inherent difficulties associated with obtaining good data in the region of the critical point.

New techniques are being utilized to investigate critical point behavior, and older techniques are being updated to include the high precision which is necessary to describe this region. Theoretical studies are being made to try to understand the behavior in this interesting region. But much more experimental and theoretical work has yet to be done before a complete and definitive description of this critical region can be obtained.

16. Acknowledgements

The principal support for this work was furnished by the National Aeronautics and Space Administration, Office of Advanced Research and Technology, Contract R-06-006-046.

We wish to acknowledge the Mechanical Engineering Department of the University of Iowa, where this work began as a dissertation. In particular, we would like to acknowledge the guidance and assistance of J. Merle Trummel, of the University of Iowa, who served as academic advisor to the first author.

We are also grateful to R. B. Stewart, presently at Worcester Polytechnic Institute, for his comments and valuable suggestions during the initial phases of this work.

The authors also take pleasure in acknowledging the help of N. A. Olien, L. A. Hall, and the staff of the Cryogenic Data Center of the National Bureau of Standards at Boulder, Colo., who offered their valuable assistance in conducting an exhaustive literature search.
