04	91.14	0.24000	220.98±0.15		106.12	0.65000	360.02±0.23
03	103.98	0.28000	232.53±0.17		115.17	0.70000	396.55±0.15
04	116.60	0.32000	245.24±0.16		126.96	0.75000	436.04±0.40
03	129.19	0.36000	259.12±0.15		142.61	0.80000	479.25±0.52
03					158.86	0.84000	520.37±0.25

extrapolation of our -90°C curve indicates that Zhdanova's²³ results for $\rho \geq 0.38$ g/cm³ are as much as 20% too high.

Helium

Helium²⁴ was also studied at 25, -50, and -90°C; the results are shown in Fig. 2. The densities are based on the work of Miller *et al.*²⁵ at 25°C and of Canfield *et al.*¹⁶ elsewhere. We are again in good agreement with our previous work¹ and about 0.3% lower than the results of Kestin *et al.*¹⁸ around 25°C. At -50 and -90°C,

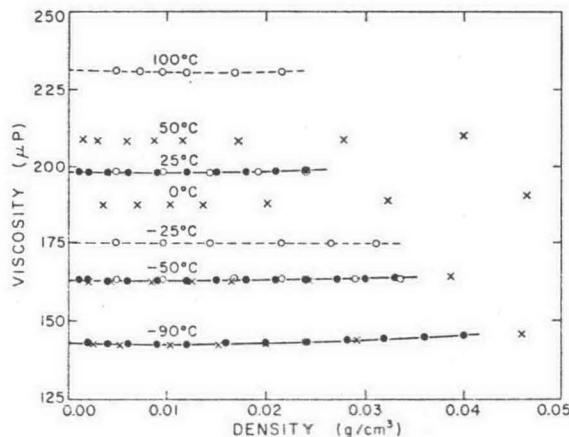

FIG. 2. Viscosity of helium vs density: ●, present results; ○, Flynn, Hanks, Lemaire, and Ross¹; X, Kao and Kobayashi.³

²³ N. F. Zhdanova, Zh. Eksp. Teor. Fiz. 31, 14 (1956) [Sov. Phys.—JETP 4, 19 (1957)].

²⁴ Purity 99.995%, from Matheson Co.

²⁵ J. E. Miller, L. W. Brandt, and L. Stroud, U.S. Bur. Mines, Rept. Invest. No. 5845 (1961).

Kao and Kobayashi's³ results average 0.2%-0.3% lower than ours. Golubev and Gnezdilov²⁶ obtain viscosities consistently steeper in the density than all the above work, but closely resembling those of Ross and Brown, which we regard as unreliable.¹ Kestin's results, Kao and Kobayashi's, and ours all tend to confirm the existence of very shallow minima in the viscosity-density curves.

Hydrogen

Hydrogen²⁷ was studied at 25, -50, and -100°C; the results are shown in Fig. 3. The densities were all taken
